

# Reproducible Research: Lessons from the Madagascar Project

## **Sergey Fomel**

Jackson School of Geosciences The University of Texas at Austin

March 5, 2011

## **Outline**

### Reproducible Research

History of Madagascar

## What is Science?

## What is Science?

Science is the systematic enterprise of gathering knowledge about the universe and organizing and condensing that knowledge into testable laws and theories. The success and credibility of science are anchored in the willingness of scientists to independent testing and replication by other scientists. This requires the complete and open exchange of data, procedures and materials.

American Physical Society, What is Science?

# From Science to Open-Source Software

Abandoning the habit of secrecy in favor of process transparency and peer review was the crucial step by which alchemy became chemistry. In the same way, it is beginning to appear that open-source development may signal the long-awaited maturation of software development as a discipline.

Eric Raymond, TAUP, 2004

# What is Reproducible Research?

- Attaching software code and data to publications
- Communicating computational results to a skeptic

An article about computational science in a scientific publication is not the scholarship itself, it is merely advertising of the scholarship. The actual scholarship is the complete software development environment and the complete set of instructions which generated the figures. J. Buckheit and D. Donoho, WaveLab

## Lessons 3 and 4

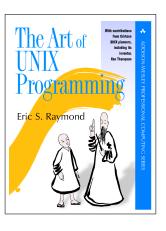

Reproducibility requires maintenance.

Maintenance requires an open community.

# **MADAGASCAR Design**

Multidimensional arrays as files

Write programs that do one thing and do it well. Write programs to work together. Write programs to handle text streams, because that is a universal interface.

**Doug McIlroy, Unix** 

## MADAGASCAR filter in C

```
#include <rsf.h>
int main(int argc, char* argv[])
    int n1, n2, i1, i2:
    float clip, *trace;
    sf file in. out:
    sf_init(argc,argv);
    in = sf_input("in");
    out = sf output("out"):
    sf_histint(in, "n1", &n1); /* trace length */
    n2 = sf leftsize(in.1): /* number of traces */
    if (!sf getfloat("clip",&clip)) sf error("Need clip=");
    trace = sf floatalloc (n1):
    for (i2=0: i2 < n2: i2++) {
        sf_floatread(trace,n1,in);
        for (i1=0: i1 < n1: i1++) {
            if (trace[i1] > clip) trace[i1] = clip;
            else if (trace[i1] < -clip) trace[i1]=-clip;
        sf floatwrite(trace.n1.out):
    exit(0):
```

# MADAGASCAR filter in Python

```
#!/usr/bin/env python
import numpy
import m8r
par = m8r.Par()
input = m8r.Input()
output = m8r.Output()
n1 = input.int("n1") # trace length
n2 = input.size(1) # number of traces
clip = par.float("clip")
trace = numpy.zeros(n1,'f')
for i2 in xrange(n2): # loop over traces
    input.read(trace)
    trace = numpy.clip(trace,-clip,clip)
    output.write(trace)
```

# MADAGASCAR SConstruct script

```
from rsf.proj import Flow
Flow('spike',None,'spike n1=1000 n2=100 | bandpass fhi=10')
Flow('cliped','spike','clip clip=0.5')
```

```
bash$ scons
scons: Building targets ...
/usr/bin/sfspike n1=1000 n2=100 | /usr/bin/sfbandpass fhi=10 > spike.rsf
< spike.rsf /usr/bin/sfclip clip=0.5 > cliped.rsf
scons: Done building targets.
bash$ sed -i' -e's/0.5/0.25/' SConstruct
bash$ scons -Q
< spike.rsf /usr/bin/sfclip clip=0.25 > cliped.rsf
```
